$\qquad$

Instructions: Using exactly four 4's, try to write a numerical expression that would equal each whole number from 0 to 10. The following rules apply:

- You must use exactly four 4's. No more, no less. You may not use any number besides four.
- You may use the following symbols:,,$+- \times, \div$, ( )
- You may not use square roots or exponents. (4 to the $4^{\text {th }}$ power would be way too big anyways)
- You may put 4's together to make 44,444 , etc.

## Examples

- $4 \times 4+4+4$ is an expression that would equal 24 .
- $4 \times(4+4+4)$ is an expression that would equal 48.
- $4 \div 4+4$ is an expression that would equal 5 , but it does not contain enough 4 's.

Can you get them all???

| Number | Expression (put multiple if you can <br> think of them!) | Number | Expression (put multiple if you can <br> think of them!) |  |
| :---: | :---: | :---: | :---: | :---: |
| 0 |  | 6 |  |  |
| 1 |  | 7 |  |  |
| 2 |  | 9 |  |  |
| 3 |  | 10 |  |  |
| 4 |  |  |  |  |
| 5 |  |  |  |  |
| Extras: <br> Other <br> numbers <br> besides <br> $0-10$ |  |  |  |  |
